

I am an XM Radio subscriber. I enjoy the service very much. Since its base is paid subscribers, it doesn't depend on surveys which are done by a relatively small number of listeners to determine programming. Their programming is much more varied than traditional AM/FM Radio. If traditional radio is worried about competition from satellite radio, then they should improve the quality and variety of their programming to attract more listeners. With the addition of local traffic and weather, XM provides a continuous public service to its subscribers. Its subscription is very affordable, and is a great use of current technology to service its listener base. I am very much opposed to HR4026 and encourage your ruling in favor of the programming provided by XM satellite radio. Thank you.
